# Debugging Detective

To fix **program**, I identified several critical issues that prevent it from running , the errors located in the document and how I corrected them.

Solution:-

1. **Incomplete Variable Assignments:**

- **The variable original is declared but never assigned the value of num before the loop starts. This is critical because num becomes 0 by the end of the while loop. Without saving the original value, the palindrome check (if reverse == original) will compare the reversed number against an empty or undefined value.**
- **There is a line that simply says num on its own , and another line where sum_digits is not properly assigned to the calculation.**

**2.Syntax Typos in Calculations:**

- **The line reverse = reverse 10 + digit is missing the multiplication operator (*). It should be reverse = (reverse * 10) + digit.**

## Missing Parentheses and Colons:

- **The print statement for "Not palindrome" is missing its closing parenthesis.**
- **The if reverse statement is split across two lines and missing the comparison operator (==) to properly check against original.**
